

## Questions for Jeff Duncan

How will we gain access to the CSD underlying database?

How will we host the FHIR interface for CSD and any other software we develop?

What is the CSD tech stack?

What is the complete CSD database schema?

How do we reconcile auditing and authentication between CSD and UMED? SSO?

How can we ensure OME can only access CSD data for the deceased?

Are there any other institutional security considerations we should be taking into account?

URL encryption?

How much information in the URL is too much? Patient ID? Patient Name?

Will we use public or synthetic data?

If synthetic, how shall we generate the data?

Will you be able to provide a test environment where we will run our software during development?

May we use anonymized production data?

How shall we handle non-unique identities? (i.e. two John Smiths with the same birthdate.)

What are the performance expectations of the system?

How many transactions per day/hour/minute are expected?

How will the system be maintained after the project is handed over to the customer?

What applications will use the proposed FHIR CSD API?
